Tetuan, capital of Spanish Morocco, welcomed General Valino, the High Commissioner, to assure him that the people are strongly loyal to Spain. Cynics may suspect that Spain herself inspired the demonstration. At any-contrast the rate the general seized the occasion to ~~highlight the~~ harmony in this part of Africa with the trouble the French are having in their end of Morocco. As peace is always better than strife, it's to be hoped that no trouble crosses the border.

3
Chiang Kai Shek's picture was borne aloft to Seoul, capital of Southern Korea, by released prisoners of war who refuse to go back to Communist China. There are 14,000 of them and they will be taken to the Island of Formosa, where Chiang has his Government. It says very little for life in ^{Red} Communist China that the men who fought for it prefer not to go back there. Millions in ~~China~~ ^{to homeland} must be envying these soldiers the chance to live in freedom on Formosa.

4
Latest oddity of the air is the Flying Fuselage, on test at Santa Ana, California. The flaps can be extended but there are no wings in the ordinary sense. The designer hopes to make such aircraft for the Army; what advantages he claims for it are not yet published.

NEWS OF INVENTION

KITCHEN MAGIC

Here's your answer to stooping and stretching, mother, in this kitchen of tomorrow— an electronic wonderland. Knobs and panels are practically non-existent for this is all push-button. A built-in toaster, right in the stove area. and now -- real kitchen magic: A wave of the hand, and — presto — a wall cabinet, almost out of nowhere. A photographic menu and recipe viewer. To get into the refrigerator, mother, just push a button. Since we still have to use a chopping block — this kitchen hasn't eliminated that need, at least not yet, we can always raise the block to a convenient height.

Not that rotisseries are ugly sights to be hidden; but why keep it exposed when a button raises it, another button opens it?

And here's your roast, mother, done to a turn.

Who said anything about kitchen drudgery?

"FLYING FUSELAGE"

In Santa Ana, California, the "Flying Fuselage," priming for a test flight. An amazing sight to behold is this experimental craft, built at a cost of 100-thousand dollars. The wingless plane, measuring 26 feet across the fuselage, reaches 44 feet when the flaps are extended for flight.

According to William Horton, the builder, the Air Force is interested in the design of his flying fuselage.

The radically-designed plane works on the principle of fencing in velocity pressure at the fuselage's outer edges. Air passing over the fuselage gives the entire surface lifting ability. Another of aviation's pioneer efforts.
