### **NUCLEAR POWER PLANT TO BE IN LATINA**

By a press conference, the engineer Mattei illustrates the features of the first Italian thermo-nuclear power station made in collaboration with the British Nuclear Power Plant Company of which the president Sir Gibb is the representative.

Later at the presence of the British Ambassador in Latina it is being laid the first foundation-stone of such plant.

The atomic reactor will have a heart made of a large prism of graphite of 24 sides, ten meter-high and a diameter of 15 meters. The charge of fuel will be given by 275 tons of uranium.

The boring tools prepare the ground for the building of the plant which is to bear 1200 miliard KWH per year and cost 20 milion pounds.
